SYLLABUS

Laboratory Code: 15CSL48

Number of Lecture Hours/Week 01I + 02P

Total Number of Lecture Hours 40

IA Marks 20

Exam Marks 80

Exam Hours 03

CREDITS - 02

- A. Laboratory Session-1: Write-up on Microprocessors, 8086 Functional block diagram, Pin diagram and description. The same information is also taught in theory class; this helps the students to understand better.
- B. Laboratory Session-2: Write-up on Instruction group, Timing diagrams, etc. The same information is also taught in theory class; this helps the students to understand better. Note: These TWO Laboratory sessions are used to fill the gap between theory classes and practical sessions. Both sessions are evaluated as lab experiments for 20 marks.

NOTE:

1. Develop and execute the following programs using 8086 Assembly Language. Any suitable assembler like MASM/TASM/8086 kit or any equivalent software may be used.
2. Program should have suitable comments.
3. The board layout and the circuit diagram of the interface are to be provided to the student during the examination.
4. Software Required: Open source ARM Development platform, KEIL IDE and Proteus for simulation

SOFT WARE PROGRAMS-PART A

1. Design and develop an assembly language program to search a key element "X" in a list of 'n' 16-bit numbers. Adopt Binary search algorithm in your program for searching.
2. Design and develop an assembly program to sort a given set of 'n' 16-bit numbers in ascending order. Adopt Bubble Sort algorithm to sort given elements.
3. Develop an assembly language program to reverse a given string and verify whether it is a palindrome or not. Display the appropriate message.
4. Develop an assembly language program to compute nCr using recursive procedure. Assume that 'n' and 'r' are non-negative integers.
5. Design and develop an assembly language program to read the current time and Date from the system and display it in the standard format on the screen.
6. To write and simulate ARM assembly language programs for data transfer, arithmetic and logical operations (Demonstrate with the help of a suitable program).
7. To write and simulate C Programs for ARM microprocessor using KEIL (Demonstrate with the help of a suitable program).

HARD WARE PROGRAMS-PART B

8.
 - a. Design and develop an assembly program to demonstrate BCD Up-Down Counter (00-99) on the Logic Controller Interface.
 - b. Design and develop an assembly program to read the status of two 8-bit inputs (X & Y) from the Logic Controller Interface and display $X*Y$.
9. Design and develop an assembly program to display messages "FIRE" and "HELP" alternately with flickering effects on a 7-segment display interface for a suitable period of time. Ensure a flashing rate that makes it easy to read both the messages (Examiner does not specify these delay values nor is it necessary for the student to compute these values).

10. Design and develop an assembly program to drive a Stepper Motor interface and rotate the motor in specified direction (clockwise or counter-clockwise) by N steps (Direction and N are specified by the examiner). Introduce suitable delay between successive steps. (Any arbitrary value for the delay may be assumed by the student).

11. Design and develop an assembly language program to

a. Generate the Sine Wave using DAC interface (The output of the DAC is to be displayed on the CRO).

b. Generate a Half Rectified Sine waveform using the DAC interface. (The output of the DAC is to be displayed on the CRO).

12. To interface LCD with ARM processor-- ARM7TDMI/LPC2148. Write and execute programs in C language for displaying text messages and numbers on LCD.

13. To interface Stepper motor with ARM processor-- ARM7TDMI/LPC2148. Write a program to rotate stepper motor.

Study Experiments:

1. Interfacing of temperature sensor with ARM freedom board (or any other ARM microprocessor board) and display temperature on LCD.

2. To design ARM cortex based automatic number plate recognition system.

3. To design ARM based power saving system.

INDEX SHEET

Sl. No	Name of the Experiment	Date			Manual Marks (Max . 20)	Record Marks (Max. 10)	Signature (Student)	Signature (Faculty)
		Conduction	Repetition	Submission of Record				
01	Laboratory Session-1:							
02	Laboratory Session-2:							
03	Search a 16 bit Number							
04	Sorting the 16 bit numbers							
05	Palindrome							
06	NcR							
07	Display System Time							
08	ARM programming							
09	C Programs for ARM microprocessor							
10	BCD Up-Down Counter							
11	7-segment display							
12	Stepper Motor interface							
13	DAC interface							
14	Interface LCD with ARM processor							
15	Interface Stepper motor with ARM processor							
Average								

Note:

- **If the student fails to attend the regular lab, the experiment has to be completed in the same week. Then the manual/observation and record will be evaluated for 50% of maximum marks.**

Course Objectives

This course will enable students to

- To provide practical exposure to the students on microprocessors, design and coding knowledge on 80x86 family/ARM.
- To give the knowledge and practical exposure on connectivity and execute of interfacing devices with 8086/ARM kit like LED displays, Keyboards, DAC/ADC, and various other devices

Course Outcomes

After studying this course, students will be able to

- Learn 80x86 instruction sets and gain the knowledge of how assembly language works.
- Design and implement programs written in 80x86 assembly language.
- Know functioning of hardware devices and interfacing them to x 86 families.
- Choose processors for various kinds of applications.

Graduate Attributes

- Engineering Knowledge
- Problem Analysis
- Modern Tool Usage
- Conduct Investigations of Complex Problems
- Design/Development of Solutions

General Instructions

- All laboratory experiments (all 7 + 6 nos) are to be included for practical examination.
- Students are allowed to pick one experiment from each of the lot.
- PART –A: Procedure + Conduction + Viva: 10 + 25 +05 (40)
- PART –B: Procedure + Conduction + Viva: 10 + 25 +05 (40)
- Change of experiment is allowed only once and marks allotted to the procedure part to be made zero.
- Students should maintain an observation book along with Manual and record.
- Observation book will be evaluated for 20 Marks and Manual for 10 Marks and final IA for 10 Marks.
- Students should complete the observation book which should include the logic and tracing of the respective program and should get it evaluated before departing from the lab.
- They should produce the lab record Next week which should include lab set programs with comments and necessary Board Lay out and Circuit diagram if any.
- If in case the student is unable to attend the regular batch, He / She should take prior permission from the concerned faculty and try to attend the next batch.

CONTENTS

MASM COMMANDS:**C :/>>cdfoldername****C:/foldername>edit filename.asm**

After this command executed in command prompt an editor window will open. Program should be typed in this window and saved. The program structure is given below.

Structure of Program:**.model tiny/small/medium/large****.Stack <some number>****.data****; Initialize data
 ; which is used in program.****.code****; Program logic goes here.
 ;****end**

To run the program, the following steps have to be followed:

C:/foldername>masm filename.asm

After this command is executed in command prompt if there are no errors in program regarding to syntax the assembler will generate an object module as discussed above.

C:/foldername>link filename.obj

After verifying the program for correct syntax and the generated object files should be linked together. For this the above link command should be executed and it will give an EXE file if the model directive is small as discussed above.

C:/foldername>debug filename.exe

After generating EXE file by the assembler it's the time to check the output. For this the above command is used and the execution of the program can be done in different ways. It is as shown below:

_g ; complete execution of program in single step.

_t ; Stepwise execution.

_d ds: starting address or ending address ; To see data in memory locations

_p ; Used to execute interrupt or procedure during stepwise execution of program

_q ; To quit the execution.

Laboratory Session-1**Write-up on Microprocessors, 8086 Functional block diagram, Pin diagram and description.**

Description:

The microprocessors functions as the CPU in the stored program model of the digital computer. Its job is to generate all system timing signals and synchronize the transfer of data between memory, I/O, and itself. It accomplishes this task via the three-bus system architecture previously discussed.

The microprocessor also has a S/W function. It must recognize, decode, and execute program instructions fetched from the memory unit. This requires an Arithmetic-Logic Unit (ALU) within the CPU to perform arithmetic and logical (AND, OR, NOT, compare, etc) functions.

The 8086 CPU is organized as two separate processors, called the Bus Interface Unit (BIU) and the Execution Unit (EU). The BIU provides H/W functions, including generation of the memory and I/O addresses for the transfer of data between the outside world -outside the CPU, that is- and the EU.

The EU receives program instruction codes and data from the BIU, executes these instructions, and store the results in the general registers. By passing the data back to the BIU, data can also be stored in a memory location or written to an output device. Note that the EU has no connection to the system buses. It receives and outputs all its data thru the BIU.

FETCH AND EXECUTE

Although the 8086/88 still functions as a stored program computer, organization of the CPU into a separate BIU and EU allows the fetch and execute cycles to overlap. To see this, consider what happens when the 8086 or 8088 is first started.

1. The BIU outputs the contents of the instruction pointer register (IP) onto the address bus, causing the selected byte or word to be read into the BIU.
2. Register IP is incremented by 1 to prepare for the next instruction fetch.
3. Once inside the BIU, the instruction is passed to the queue. This is a first-in, first-out storage register sometimes likened to a "pipeline".
4. Assuming that the queue is initially empty, the EU immediately draws this instruction from the queue and begins execution.

5. While the EU is executing this instruction, the BIU proceeds to fetch a new instruction. Depending on the execution time of the first instruction, the BIU may fill the queue with several new instructions before the EU is ready to draw its next instruction.

The BIU is programmed to fetch a new instruction whenever the queue has room for one (with the 8088) or two (with the 8086) additional bytes. The advantage of this pipelined architecture is that the EU can execute instructions almost continually instead of having to wait for the BIU to fetch a new instruction.

There are three conditions that will cause the EU to enter a "wait" mode. The first occurs when an instruction requires access to a memory location not in the queue. The BIU must suspend fetching instructions and output the address of this memory location. After waiting for the memory access, the EU can resume executing instruction codes from the queue (and the BIU can resume filling the queue).

The second condition occurs when the instruction to be executed is a "jump" instruction. In this case control is to be transferred to a new (nonsequential) address. The queue, however, assumes that instructions will always be executed in sequence and thus will be holding the "wrong" instruction codes. The EU must wait while the instruction at the jump address is fetched. Note that any bytes presently in the queue must be discarded (they are overwritten).

One other condition can cause the BIU to suspend fetching instructions. This occurs during execution of instructions that are slow to execute. For example, the instruction AAM (ASCII Adjust for Multiplication) requires 83 clock cycles to complete. At four cycles per instruction fetch, the queue will be completely filled during the execution of this single instruction. The BIU will thus have to wait for the EU to pull over one or two bytes from the queue before resuming the fetch cycle.

A subtle advantage to the pipelined architecture should be mentioned. Because the next several instructions are usually in the queue, the BIU can access memory at a somewhat "leisurely" pace. This means that slow-memory parts can be used without affecting overall system performance.

SAMPLE PROGRAMS:**1. Write an ALP to move the data between the Registers.**

```
.model tiny
.data
    num1 db 50h
    num2 dw 1234h

.code
    Mov ax,@data
    Mov ds,ax    ;DATA SEGMENT INITIALIZATION

    mov al,num1
        mov ah,al
    mov bh,ah
    mov bl,al    ;MOVES BYTE LENGTH OF DATA FROM REG.AL TO REG.BL

    mov cx,num2
        mov dx,cx
    mov si,ax
    mov di,si    ;MOVES WORD LENGHT OF DATA FROM REG.CX TO REG.DX

    int 3        ;TERMINATES THE PROGRAM EXECUTION

end
```

2. Write and ALP to move immediate data to Registers.

```
.model tiny
.code
    mov al,10h
    mov ah,10
    mov cl,50h
    mov ch,50    ;MOVES IMMEDIATE VALUE TO 8 BIT REGISTER

    mov bx,1234h
    mov dx,1234  ;MOVES IMMEDIATE VALUE TO 16 BIT REGISTER

    mov si,4000h
    mov di,2000h

    int 3        ;TERMINATE THE PROGRAM EXECUTION

end
```

3. Write an ALP to add two numbers and to store the result in the specified destination.

.model small

.data

```
num1 db 05h
      num2 db 06h
      num3 dw 1234h
      num4 dw 0002h
sum db ?
      sum2 dw ?
```

.code

```
      mov ax,@data
mov ds,ax      ;INITIALIZES DATA SEGMENT

      mov al,num1
      mov bl,num2
add al,bl      ;ADD THE 2 BYTES
mov sum,al     ;STORES THE RESULT IN MEMORY

mov cx,num3
add cx,num4    ;ADD THE 2 WORDS
mov sum2,cx   ;STORES THE RESULT IN MEMORY

int 3         ;TERMINATE THE PROGRAM EXECUTION

align 16      ;DS STARTS FROM PAGE BOUNDARY
end
```

4. Write and ALP to multiply two 16-bit numbers and to store the result in the specified location.

.model small

.data

```
num1 dw 1234h
num2 dw 0ffffh
res dw 5 dup(0)
```

.code

```
Mov ax,@data
```

```
Mov ds,ax    ;INITIALIZATION OF DATA SEGMENT

mov ax,num1
mov dx,num2
mul dx       ;MULTIPLIES 2 16-BIT NUMBERS

mov res,ax
mov res+2,dx ;STORES THE IN MEMORY

int 3       ;TERMINATE THE PROGRAM EXECUTION
align 16    ;DS STARTS FROM PAGE BOUNDARY
end
```

5. Write an ALP to divide a 32-bit unsigned number by a 16-bit unsigned number and to store the quotient and remainder in the specified location.

.model small

.data

```
Dvd dd 12345678h
Dvr dw 0ffffh
Quot dw ?
Remd dw ?
```

.code

```
Mov ax,@data
Mov ds,ax    ;INITIALIZATION OF DATA SEGMENT

Mov si,offset dvd
Mov ax,wordptr[si]
Mov dx,wordptr[si+2]

Mov cx, dvr
div cx

mov quot ,ax
mov remd, dx

int 3       ;TERMINATES THE PROGRAM EXECUTION
align 16    ;DS STARTS FROM PAGE BOUNDARY
end
```

6. Write an ALP to illustrate the operation of AAA instruction. Use Macros**.model small****.data**

```
read macro          ;Start of a macro
mov ah,01h          ;read a single key stroke
int 21h
endm                ;end of macro
```

.code

```
Mov ax,@data
Mov ds,ax          ;INITIALIZATION OF DATA SEGMENT

read              ;CALL MACRO READ
mov bl,al         ;STORE THE READ KEY IN BL REGISTER

read
mov cl,al

add al,bl         ;ADD AL WITH BL AND STORES THE RESULT IN AL.

mov dl,al
mov ah,0
aaa              ;ADJUST THE AL VALUE TO UNPACKED BCD

mov si,ax

int 3            ;TERMINATES THE PROGRAM EXECUTION
end
```

SOFTWARE PROGRAMS: PART A

Program No.01.

Date:

BINARY SEARCH**AIM:**

Design and develop an assembly language program to search a key element "X" in a list of 'n' 16-bit numbers. Adopt Binary search algorithm in your program for searching.

.model small

```

.data                                     ;start of the data segment

arr    dw 0111h,0112h,0113h,0114h,0115h ; 'n' elements to be searched
len    dw ($-arr)/2
key    equ 0116h                          ; key element to be searched
msg1   db "found$"
msg2   db "not found$"

.code                                     ; start of the code segment

mov ax,@data                               ;initialization of data segment
mov ds,ax

mov bx,00                                  ; first data position to bx.
mov dx,len                                  ; last data position to dd.
mov cx,key

again: cmp bx,dx
        ja notfnd

mov ax,bx
add ax,dx
shr ax,1                                    ;Get the middle element of array
mov si,ax
add si, si

cmp cx,arr[si]                              ;compare the key with middle
jae big                                     ; element of array

```

```
    dec ax
    mov dx,ax                ;last element of new array to dx
    jmp again

big:   je found
        inc ax

        mov bx,ax
        jmp again

found: lea dx,msg1        ;content of the string to be displayed.
        jmp displ

notfnd: lea dx,msg2      ;content of the string to be displayed.

displ : mov ah,09h
        int 21h
        int 3                ; Terminates the execution
end           ;end of program
```

Conclusion:

This program performs a search for a key element in an array. If the search element is found it will display a message '**found**'. As the search element (key element in program) is not present in the given array it will display a message '**not found**'.

Date:**Signature of the staff**

Program No.02.**Date:****SORTING A GIVEN SET OF 16-BIT UNSIGNED INTEGERS INTO ASCENDING ORDER**

Design and develop an assembly program to sort a given set of 'n' 16-bit numbers in ascending order. Adopt Bubble Sort algorithm to sort given elements.

.model small**.data**

ARR DW 3333h, 4444h, 1111h, 9999h, 5555h, 2222h, 7777h, 8888h, 6666h

; The numbers to be sorted

; to have a count of number of Comparison

MOV SI, 00

Inner : inc bx

MOV AX, ARR [SI]**INC SI****INC SI**

; Get the next value

CMP AX, ARR [SI]; **Perform the comparison****JBE SKIP**; Skip if 1st Value is less than 2nd.**XCHG AX, ARR [SI]**; **Else Exchange the two values.****MOV ARR [SI-2], AX**

; Swap the two values.

SKIP: **CMP BX, CX**

; compare the total no of Comparison

JL INNER

; Repeat if necessary.

LOOP OUTER ; Inner loop is for no of iterations
INT 3H ; Outer loop is for no of comparison
END START

Conclusion:

This program will sort the given numbers in ascending order. The sorted numbers will be stored directly in the **data Segment**. To view the data segment the following code must be used.

-d ds: 0

Date:

Signature of the staff

Program No.03.

Date:

Check a string for a Palindrome

Develop an assembly language program to reverse a given string and verify whether it is a palindrome or not. Display the appropriate message.

.model small**.data**

```

str1  db "alam"                ; String to be checked for palindrome
slen  equ ($-str1)
str2  db 40 dup(0)
msg1  db "Palindrome$"
msg2  db "Not Palindrome$"

```

.code

```

start:  mov  ax,@data
          mov  ds,ax
          mov  es,ax                ; Initialize extra segment

          mov  cx,slen              ; Length of the string
          lea  si, str1
          add  si,slen - 1          ; get the last byte of the data
          lea  di, str2

up:     mov  al,[si]
          mov  [di],al              ; load the byte from [Si] to [Di]
          dec  si
          inc  di
          loop up                    ; Repeat the process

          lea  si, str1
          lea  di, str2
          mov  cx,slen
          cld                          ; Clear the direction flag
repe   cmpsb                      ; compare the string bytes present in SI & DI
          jne  down                  ; Jump if the strings are not equal

          lea  dx, msg1
          jmp  down1
down:  lea  dx, msg2

```

```
down1: mov    ah, 09h
          int    21h
          int    3                ; Terminate the program
          end   start
```

Conclusion:

This program reverse the string provided in data segment by keeping the original string as it is and compares both the strings. It will check each and every character. If all the characters are same then the given string is said to be as palindrome and it will display a message “**palindrome**” on screen otherwise the given string is not palindrome and it will display a message “**not palindrome**” on screen.

Program No.04.

Date:

NcR

Develop an assembly language program to compute nCr using recursive procedure. Assume that 'n' and 'r' are non-negative integers.

.model small**.stack 20****.data**

```
n      db 08h
r      db 05h
ncr    db ?
```

.code

```
start: mov  ax,@data
        mov  ds,ax
        mov  ncr,00h
        mov  al,n
        mov  bl,r
        call encer
        int  3
```

encer proc

```
para1: cmp  al,bl           ; compare 'n','r' for equality
        je  para8
para2: cmp  bl,00h         ; compare 'r' with 00
        je  para8
para3: cmp  bl,01h         ; compare 'r' with 01h
        je  para10
para4: dec  al             ; decrement 'n'
        cmp bl,al
        je  para9
para5: push ax             ; Push 'n' to the stack
        push bx            ; Push 'r' to the stack
        call encer
para6: pop  bx             ; Get 'r' and 'n' from the stack
        pop  ax
        dec  bl
        push ax
        push bx
```

```
        call    encer
para7: pop    bx
        pop    ax
        ret
para8: inc    ncr
        ret                                ; Store the results
para9: inc    ncr
para10: add   ncr,al
        ret
encer endp
        end    start
```

Conclusion:

This program performs nCr using recursive procedure. Output is stored in data segment. To observe the output in data segment we have to search for our given 'n' and 'r' values as program is written to store the result after the given data in data segment.

The nCr Value for 8 and 5 is 56, But the output will be shown as 38 which is the Hexa value of 56.

Date:**Signature of the staff**

Program No.05.**Date:****DISPLAY SYSTEM TIME**

Design and develop an assembly language program to read the current time and Date from the system and display it in the standard format on the screen.

```
.MODEL SMALL
```

```
.DATA
```

```
msg    db "The Time is: "  
        hrs    db ?,?, ' : '  
        mins   db ?,?, '(hh:mm) ',10,13  
  
        db "The Date is: "  
        da    db ?,?, '/'  
        mon   db ?,?, '/'  
        yea   db ?,?, '(dd/mm/yy)', 10,13,'$'
```

```
.CODE
```

```
MOV AX,@DATA
```

```
MOV DS, AX
```

```
; Time Part
```

```
    mov  ah,2ch                ; DOS function to read system time  
    int  21h
```

```
    mov  al,ch                ; load the hours to 'al'  
    aam                       ; ASCII adjust after multiplication  
    add  ax, 3030h  
    mov  hrs, ah  
    mov  hrs+1, al
```

```
    mov  al,cl                ; load the seconds to 'al'  
    aam  
    add  ax, 3030h  
    mov  mins, ah  
    mov  mins+1, al
```

```
; Day Part
MOV AH, 2AH ; To get System Date
INT 21H
MOV AL, DL ; Day is in DL
AAM
Add ax,3030h
mov da,Ah
mov da +1, al

MOV AL, DH ; Month is in DH
AAM
Add ax, 3030h
MOV mon,AH
mov mon+1,al

; YEAR

ADD CX, 0F830H; To negate the effects of 16bit value,

MOV Al, cl ; since AAM is applicable only for AL (YYYY -> YY)
aam
Add ax, 3030h

mov yea,ah
mov yea+1,al

    lea dx,msg ; Display the time
    mov ah,09h
    int 21h

int 3

end
```

Conclusion:

This program displays the present system time. Our program displays only the hours and minutes in the format HH: MM. By using the same **DOS function** we can also display the seconds and milliseconds.

Program No.06.

Date:

Simple ARM Programs

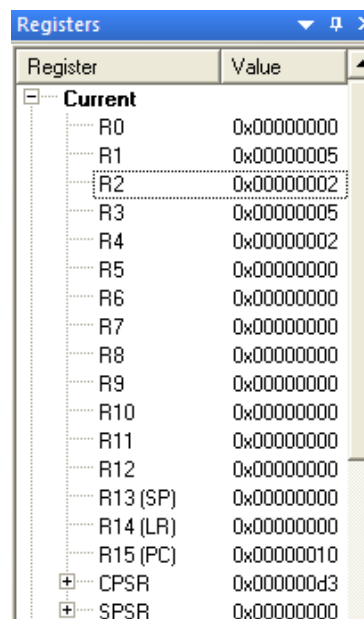

To write and simulate ARM assembly language programs for data transfer, arithmetic and logical operations (Demonstrate with the help of a suitable program).

1. Data Transfer.

The below assembly level program moves the 32 bit data from register to register.

```
area movt, code, readonly
entry
mov r1,#0005      ; Mov immediate 32 bit data to r1
mov r2,#0002      ; Mov immediate 32 bit data to r1
mov r3,r1         ; Register-Register movement
mov r4,r2         ; Register-Register movement

stop b stop      ; End of the program
end
```

Register	Value
Current	
R0	0x00000000
R1	0x00000005
R2	0x00000002
R3	0x00000005
R4	0x00000002
R5	0x00000000
R6	0x00000000
R7	0x00000000
R8	0x00000000
R9	0x00000000
R10	0x00000000
R11	0x00000000
R12	0x00000000
R13 (SP)	0x00000000
R14 (LR)	0x00000000
R15 (PC)	0x00000010
CPSR	0x000000d3
SPSR	0x00000000

2. Arithmetic Operations

A. Addition, Subtraction and Multiplication:

area addt, code, readonly

entry

mov r1,#0005

; Mov immediate 32 bit data to r1

mov r2,#0002

; Mov immediate 32 bit data to r2

add r3,r2,r1

; Add the contents present in r2 with the contents of r1 and store in r3

sub r5,r1,r2

; Subtract; r5 = r1-r2

mul r6,r1,r2

; Multiply

mov r7,r6

add r7,#2

; Add immediate data

mov r8,r7

sub r8,#3

; Subtract immediate data

mov r9,r8

stop b stop
end

Register	Value
Current	
R0	0x00000000

'C' PROGRAMS FOR ARM PROCESSOR

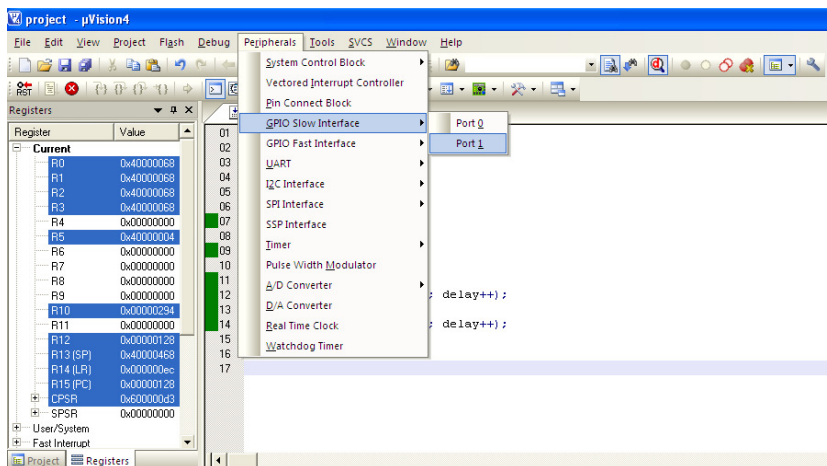

To write and simulate C Programs for ARM microprocessor using KEIL
(Demonstrate with the help of a suitable program)

**Program: To write a C program to Blink a LED /Port Pin with LPC 2148 ARM 7
Microcontroller.**

```
#include <lpc214x.h>                //Header File "x" can be wrt to controller
unsigned int delay;
```

```
int main(void)
{
    IO1DIR = (4);                    // Bit No 4 (0100) will be activated

    while(1)                          // If True
    {
        IO1CLR = (04);                // Clear Bit 04 of GPIO1
        for (delay=0 ;delay<5000; delay++); // Call Delay
        IO1SET = (04);                // Set Bit 04 of GPIO1
        for (delay=0; delay<5000; delay++); // Call Delay
    }
}
```

HARDWARE
PROGRAMS:
PART B

Program No.08.**Date:****COUNTERS AND MULTPLYER**

a. Design and develop an assembly program to demonstrate BCD Up-Down Counter (00-99) on the Logic Controller Interface.

```
.model small
.data
pa equ 0d800h
pb equ 0d801h
pc equ 0d802h
ctrl equ 0d803h

.code
mov ax, @data
mov ds, ax

mov al, 80h
mov dx, ctrl
out dx, al

mov cx, 0Ah      ; Load 10 Counts
mov al, 00h
Next: mov dx, pa      ; Configure Port A as output port and send the of counts
out dx, al
call delay
inc al           ; Perform up counting.
loop Next

mov cx, 0Ah      ; Load 10 Counts
mov al, 09h
rpt:  mov dx, pa
out dx, al
call delay
dec al           ; Perform up counting.
loop rpt
int 3h
```

```
delay proc

push cx
push bx

mov cx, 0ffffh
  L1: mov bx, 8fffh
     L2: dec bx
jnz L2
loop L1

pop bx
pop cx

ret
delay endp
end
```

Conclusion:

The program performs the up-down counter based on the input data given on logic controller read through port B. If the input is zero then it performs down counter starting from 99 down to 00 and if other than zero is the input then it performs up counter starting from 00 down to 99. And the counting will continue until a key 'q' is pressed in the key board, after displaying the count on logic controller every time it checks whether a key 'q' is pressed or not.

While observing the output of down counter or up counter if the input changes then from that point the counting will also changes. Suppose if the input is zero then it perform down counting from 99 to 00 after some time when the output is 50 then if we change the input other than zero then from that point it will start up counting that is form 50, 51, 52. and so on.

b. Design and develop an assembly program to read the status of two 8-bit inputs (X & Y) from the Logic Controller Interface and display X*Y.

.model small**.data**

```
pa equ 0d800h
pb equ 0d801h
pc equ 0d802h
ctrl equ 0d803h
```

.code

```
    movax,@data
    movds,ax

    mov al,82h ; Control word (PB as input port and PA as output port)
    mov dx, ctrl
    out dx, al

    mov dx, pb
    in al,dx      ; Read the first 8 bit number
    mov bl,al     ; Store the first number

top:  mov ah,1    ; Read a character from the key board
      int 21h
      cmp al,13  ; Compare the character with the "ENTER" key, cmp al,0dh
      jnz top
      mov dx, pb ; Read the Second 8 bit number
      in al,dx   ; Store the first number
      mul bl     ; Multiplybl*al

      mov dx, pa
      out dx, al ; Display the result
      int 3
      end
```

Conclusion:

The program performs the multiplication between two bytes and gives the result. First byte is read from the port B of logic controller (user has to provide) and waits for enter key to be pressed and once enter key is and it reads the Second byte and multiplies and displays the result through Port A.

Program No.09.

Date:

7-SEGMENT DISPLAY INTERFACE

Design and develop an assembly program to display messages "FIRE" and "HELP" alternately with flickering effects on a 7-segment display interface for a suitable period of time. Ensure a flashing rate that makes it easy to read both the messages (Examiner does not specify these delay values nor is it necessary for the student to compute these values).

.model small**.stack 100****.data**

```

pa    equ 0d800h           ; Port address
pb    equ 0d801h
pc    equ 0d802h
ctrl  equ 0d803h           ; Control word address
str1  db 8eh, 0f9h, 88h, 86h ; Hexa values for "FIRE"
str2  db 89h, 86h, 0c7h, 8ch ; Hexa values for "HELP"

```

.code

```

start: mov ax, @data
        mov ds, ax           ; data segment Initialization

        mov al, 80h         ; control word
        mov dx, ctrl
        out dx, al

again: mov bx, offset str1
        call display        ; Jump to display procedure
        call delay          ; Jump to delay procedure
        mov bx, offset str2
        call display
        call delay

        mov ah, 06h        ; direct console input or output
        mov dl, 0ffh
        int 21h            ;get character from keyboard buffer (if any)
        cmp al, 'q'

```

```

        jne    again
        int    3                ; Terminate the program
display proc
        mov    si, 03h          ; To get the last byte
up1:    mov    cl, 08h
        mov    ah, [bx+si]     ; Load the data bit to 'ah'
up:    mov    dx, pb
        rol    ah, 1           ; Rotate each bit in the data by one
        mov    al, ah
        out    dx, al          ; Out the first bit

        call   clock
        dec    cl
        jnz    up              ; repeat the steps '08' times
        dec    si
        cmp    si, -1
        jne    up1
        ret                    ; return back to main program
display endp

clock proc
        mov    dx, pc
        mov    al, 01h         ; rising edge of clock pulse
        out    dx, al
        mov    al, 0           ; falling edge of the clock pulse
        out    dx, al
        mov    dx, pb
        ret

clock endp

delay proc
        push   cx
        push   bx
        mov    cx, 0ffffh
d2:    mov    bx, 8ffffh
d1:    dec    bx
        jnz    d1
        loop   d2
        pop    bx

```

```
    pop    cx
    ret
delay  endp

    end    start
```

Conclusion:

This program displays "FIRE" and "HELP" on seven segment display interface recursively one after the other with some delay till key 'q' is pressed on key board. It's not going to read any data from interface device. The data which has to be displayed is provided in the program itself.

Date:**Signature of the staff**

Program No.10.

Date:

STEPPER MOTOR INTERFACE

Design and develop an assembly program to drive a Stepper Motor interface and rotate the motor in specified direction (clockwise or counter-clockwise) by N steps (Direction and N are specified by the examiner). Introduce suitable delay between successive steps. (Any arbitrary value for the delay may be assumed by the student).

.model small**.data**

```

pa    equ 0d800h
pb    equ 0d801h
pc    equ 0d802h
ctrl  equ 0d803h
nstep db 2           ; Initialize the number of steps

```

.code

```

start: mov  ax, @data
        mov  ds, ax

```

```

        mov  al, 80h           ; All ports are output ports
        mov  dx, ctrl
        out  dx, al

```

```

        mov  bh, nstep
        mov  al, 88h

```

```

again1: call step
        rol  al, 1           ; for counter-clock wise direction
                               ; Replace rol al,1 with ror al,1 for clock wise direction
        dec  bh
        jnz  again1

```

```

        int  3

```

step proc

```

        mov  dx, pa
        out  dx, al

```

```
        push  cx
        push  bx

        mov   cx, 0ffffh
d2:    mov   bx, 8ffffh
d1:    dec   bx
        jnz   d1
        loop  d2

        pop   bx
        pop   cx

        ret
step  endp
        end   start
```

Conclusion:

This program drives a stepper motor interface to rotate by 8 steps in anti-clockwise direction. After each rotation a delay is introduced to observe the rotation. After completing the rotations the execution will get stopped.

Date:**Signature of the staff**

Program No.11.**Date:****DAC INTERFACE**

Design and develop an assembly language program to

- a. Generate the Sine Wave using DAC interface (The output of the DAC is to be displayed on the CRO).
- b. Generate a Half Rectified Sine waveform using the DAC interface. (The output of the DAC is to be displayed on the CRO).

next:  mov  dx, pa
        out  dx, al    ; put the result to the ports

        call delay

```

```

    mov    al, bl
    mov    dx, pa
    out    dx, al           ; Out the number of 01s present in the I/P bits
    int    3

delay  proc                ; Delay procedure
    push  cx
    push  bx

    mov   cx, 0ffffh
d2:    mov   bx, 8fffh
d1:    dec   bx
       jnz  d1
       loop d2

    pop   bx
    pop   cx
    ret

delay  endp
end    start

```

Conclusion:

The program reads port B of 82C55A which is an input port. If input contains an odd number of 1's (that is the number of LED's at logic 1) then the output will be 00 at port A, which is an output port, indicating input is odd parity and after some delay the number of 1's present in input will be displayed through port A on the output.

Similarly If input contains an even number of 1's (that is the number of LED's at logic 1) then the output will be FF at port A, which is an output port, indicating input is even parity and after some delay the number of 1's present in input will be displayed through port A on the output.

2. Write two ALP modules stored in two different files; one module is to read a character from the keyboard and the other one is to display a character. Use the above two modules to read a string of characters from the keyboard terminated by the carriage return and print the string on the display in the next line.

        int    21h
        endm
```

Conclusion:

This program reads the character entered through the Key board and stores in the consecutive specified memory locations. This process repeats till the ENTER Key (carriage return) is pressed. Once the ENTER key (carriage return) is pressed the character stored in the consecutive memory locations will be displayed on the next line.

3. Scan a 8x3 keypad for key closure and to store the code of the key pressed in a memory location and display on screen. Also display row and column numbers of the key pressed.

```

down3:  int  3
end     start
```

5. To interface relay with ARM processor-- ARM7TDMI/LPC2148. Write a program for the on and off of a relay.

```
#include <LPC214x.H>          /* LPC214x definitions */

#define RELAY1                (1 << 4) // P0.4
#define KEY_CTRL_PIN         IO1PIN
#define R1ON                  (1 << 16)    //KEY1        P1.16
#define R1OFF                 (1 << 20)    //KEY5        P1.20

//////////////////// MAIN //////////////////////////////////////
int main (void)
{
    IO1DIR =    ~ (R1ON | R1OFF);

    IO0DIR = (RELAY1);

    while (1)
    {

        if (!(KEY_CTRL_PIN & R1ON)) //R1ON key pressed

        {
            IO0SET = 0X00000010 ;

        }

        if (!(KEY_CTRL_PIN & R1OFF))//R1OFF key pressed

        {
            IO0CLR = 0X00000010 ;

        }

    }
}
```

6. To interface DAC with ARM processor-- ARM7TDMI/LPC2148. Write a program to convert digital value to an analog value using DAC.

```
#include <LPC214x.H>          /* LPC214x definitions */

////////// Init DAC //////////
Init_DAC()
{
    // Convert Port pin 0.25 to function as DAC
    PINSEL1 = 0X00080000;
    DACR = 0;
}

////////// Write DAC //////////
Write_DAC(unsigned int dacval)
{
    DACR = dacval << 6;
}
void delay(unsigned int count)
{
    int j=0,i=0;

    for(j=0;j<count;j++)
    {
        for(i=0;i<120;i++);
    }
}

////////// MAIN //////////
int main (void)
{
    Init_DAC();

    while(1)
    {
        Write_DAC(00);
        delay(100);          // change this value to change Frequency
        Write_DAC(1023);    // change this value to change Amplitude
        delay(100);         // change this value to change Frequency
    }
}
```

ANNEXURES:**Instruction Set:**

Instructions	Operands	Description
MOV	REG, memory memory, REG REG, REG memory, immediate REG, immediate SREG, memory memory, SREG REG, SREG SREG, REG	Copy operand2 to operand1. The MOV instruction <u>cannot</u> : <ul style="list-style-type: none"> • Set the value of the CS and IP registers. • Copy value of one segment register to another segment register (should copy to general register first). • Copy immediate value to segment register (should copy to general register first). Algorithm: operand1 = operand2 Ex: Mov AX,BX ;Copy contents of BX to AX Mov si,00h ;load Si with 00h
MUL	REG Memory	Unsigned multiply. Multiply the contents of REG/Memory with contents of AL register. Algorithm: When operand is a byte : AX = AL * operand. When operand is a word : (DX: AX) = AX * operand.
CMP	REG, memory memory, REG REG, REG memory, immediate REG, immediate	Compare. Algorithm:operand1 - operand2 Result is not stored anywhere, flags are set (OF, SF, ZF, AF, PF, CF) according to result.
JMP	Label	Unconditional Jump. Transfers control to another part of the program. <i>4-byte address</i> may be entered in this form: 1234h: 5678h, first value is a segment second value is an offset. Algorithm: always jump
JA	Label	Jump If Above. Short Jump if first operand is Above second operand (as set by CMP instruction). Unsigned. Algorithm: if (CF = 0) and (ZF = 0) then jump

JAE	Label	<p>Jump If Above Or Equal</p> <p>Short Jump if first operand is Above or Equal to second operand (as set by CMP instruction). Unsigned.</p> <p>Algorithm:</p> <p>if CF = 0 then jump</p>
JB	Label	<p>Jump If Below.</p> <p>Short Jump if first operand is Below second operand (as set by CMP instruction). Unsigned.</p> <p>Algorithm:</p> <p>if CF = 1 then jump</p>
JBE	Label	<p>Jump If Below Or Equal</p> <p>Short Jump if first operand is Below second operand (as set by CMP instruction). Unsigned.</p> <p>Algorithm:</p> <p>if CF = 1 then jump</p>
JC	Label	<p>Jump If Carry</p> <p>Short Jump if Carry flag is set to 1.</p> <p>Algorithm:</p> <p>if CF = 1 then jump</p>
JE	Label	<p>Jump If Equal.</p> <p>Short Jump if first operand is Equal to second operand (as set by CMP instruction). Signed/Unsigned.</p> <p>Algorithm:</p> <p>if ZF = 1 then jump</p>
JG	Label	<p>Jump If Greater</p> <p>Short Jump if first operand is Greater then second operand (as set by CMP instruction). Signed.</p> <p>Algorithm:</p> <p>if (ZF = 0) and (SF = OF) then jump</p>

JGE	Label	<p>Jump If Greater Or Equal.</p> <p>Short Jump if first operand is Greater or Equal to second operand (as set by CMP instruction). Signed.</p> <p>Algorithm:</p> <p style="padding-left: 40px;">if SF = OF then jump</p>
JL	Label	<p>Jump If Less than.</p> <p>Short Jump if first operand is Less than second operand (as set by CMP instruction). Signed.</p> <p>Algorithm:</p> <p style="padding-left: 40px;">if SF <> OF then jump</p>
JLE	Label	<p>Jump If Less Or Equal.</p> <p>Short Jump if first operand is Less or Equal to second operand (as set by CMP instruction). Signed.</p> <p>Algorithm:</p> <p style="padding-left: 40px;">if SF <> OF or ZF = 1 then jump</p>
JNZ	Label	<p>Jump If Non Zero.</p> <p>Short Jump if Not Zero (not equal). Set by CMP, SUB, ADD, TEST, AND, OR, XOR instructions.</p> <p>Algorithm:</p> <p style="padding-left: 40px;">if ZF = 0 then jump</p>
JZ	Label	<p>Jump If Zero.</p> <p>Short Jump if Zero (equal). Set by CMP, SUB, ADD, TEST, AND, OR, XOR instructions.</p> <p>Algorithm:</p> <p style="padding-left: 40px;">if ZF = 1 then jump</p>
LEA	REG, memory	<p>Load Effective Address.</p> <p>Algorithm:</p> <ul style="list-style-type: none"> • REG = address of memory (offset)
LOOP	Label	<p>Decrease CX, jump to label if CX not zero.</p> <p>Algorithm:</p> <ul style="list-style-type: none"> • CX = CX - 1 • if CX <> 0 then

		<ul style="list-style-type: none"> ○ jump <p>else</p> <ul style="list-style-type: none"> ○ no jump, continue
ADD	REG, memory memory, REG REG, REG memory, immediate REG, immediate	Add. Algorithm: operand1 = operand1 + operand2
AND	REG, memory memory, REG REG, REG memory, immediate REG, immediate	Logical AND between all bits of two operands. Result is stored in operand1. These rules apply: 1 AND 1 = 1; 1 AND 0 = 0 0 AND 1 = 0; 0 AND 0 = 0
OR	REG, memory memory, REG REG, REG memory, immediate REG, immediate	Logical OR between all bits of two operands. Result is stored in first operand. These rules apply: 1 OR 1 = 1; 1 OR 0 = 1 0 OR 1 = 1; 0 OR 0 = 0
SUB	REG, memory memory, REG REG, REG memory, immediate REG, immediate	Subtract. Algorithm: operand1 = operand1 - operand2
DAA	No Operands	Decimal adjust After Addition. Corrects the result of addition of two packed BCD values. Algorithm: if low nibble of AL > 9 or AF = 1 then: <ul style="list-style-type: none"> • AL = AL + 6 • AF = 1 if AL > 9Fh or CF = 1 then: <ul style="list-style-type: none"> • AL = AL + 60h • CF = 1

DAS	No Operands	<p>Decimal adjust After Subtraction. Corrects the result of subtraction of two packed BCD values.</p> <p>Algorithm: if low nibble of AL > 9 or AF = 1 then:</p> <ul style="list-style-type: none"> • AL = AL - 6 • AF = 1 <p>if AL > 9Fh or CF = 1 then:</p> <ul style="list-style-type: none"> • AL = AL - 60h • CF = 1
INC	REG memory	<p>Increment.</p> <p>Algorithm: operand = operand + 1</p>
DEC	REG Memory	<p>Decrement.</p> <p>Algorithm: operand = operand - 1</p>
DIV	REG Memory	<p>Unsigned divide.</p> <p>Algorithm: when operand is a byte: AL = AX / operand AH = remainder (modulus) when operand is a word: AX = (DX AX) / operand DX = remainder (modulus)</p>
SHL	<p>memory, immediate REG, immediate</p> <p>memory, CL REG, CL</p>	<p>Shift Left. Shift operand1 Left. The number of shifts is set by operand2.</p> <p>Algorithm:</p> <ul style="list-style-type: none"> • Shift all bits left, the bit that goes off is set to CF. • Zero bit is inserted to the right-most position.
SHR	<p>memory, immediate REG, immediate</p> <p>memory, CL REG, CL</p>	<p>Shift Right. Shift operand1 Right. The number of shifts is set by operand2.</p> <p>Algorithm:</p> <ul style="list-style-type: none"> • Shift all bits right, the bit that goes off is set to CF. • Zero bit is inserted to the left-most position.

ROL	memory, immediate REG, immediate memory, CL REG, CL	Rotate Left. Rotate operand1 left. The number of rotates is set by operand2. Algorithm: Shift all bits left, the bit that goes off is set to CF and the same bit is inserted to the right-most position.
ROR	memory, immediate REG, immediate memory, CL REG, CL	Rotate Right. Rotate operand1 right. The number of rotates is set by operand2. Algorithm: Shift all bits right, the bit that goes off is set to CF and the same bit is inserted to the left-most position.
RCL	<i>memory, immediate</i> <i>REG, immediate</i> <i>memory, CL</i> <i>REG, CL</i>	Rotate operand1 left through Carry Flag. The number of rotates is set by operand2. Algorithm: Shift all bits left, the bit that goes off is set to CF and previous value of CF is inserted to the right-most position. Example: STC ; set carry (CF=1). MOV AL, 1Ch ; AL = 00011100b RCL AL, 1 ; AL = 00111001b, CF=0. RET  OF=0 if first operand keeps original sign.
CALL	procedure name label	Transfers control to procedure, return address is (IP)pushed to stack.
RET	No operands Or even immediate date	Return from near procedure. Algorithm: <ul style="list-style-type: none"> • Pop from stack: <ul style="list-style-type: none"> ○ IP if <u>immediate</u> operand is present: SP = SP + operand
IN	AL, im.byte AL, DX AX, im.byte AX, DX	Input from port into AL or AX . Second operand is a port number. If required to access port number over 255 - DX register should be used.
OUT	AL, im.byte AL, DX AX, DX	Output from AL or AX to port. First operand is a port number. If required to access port number over 255 - DX register should be used.

POP	REG SREG memory	Get 16 bit value from the stack. Algorithm: Operand = SS : [SP](top of stack) $SP = Sp + 2.$
PUSH	REG SREG memory	Store 16 bit value in the stack. Algorithm: <ul style="list-style-type: none"> • $SP = SP - 2$ • $SS:[SP]$ (top of the stack) = operand
XOR	REG, memory memory, REG REG, REG memory, immediate REG, immediate	Logical XOR (Exclusive OR) between all bits of two operands. Result is stored in first operand. These rules apply: 1 XOR 1 = 0; 1 XOR 0 = 1 0 XOR 1 = 1; 0 XOR 0 = 0
XCHG	REG, memory memory, REG REG, REG	Exchange values of two operands. Algorithm: operand1 < - > operand2
XLAT	No Operands	Translate byte from table. Copy value of memory byte at DS:[BX + unsigned AL] to AL register. Algorithm: $AL = DS:[BX + unsigned AL]$
AAA	No Operands	ASCII Adjust after Addition. Corrects result in AH and AL after addition when working with BCD values. Algorithm: if low nibble of AL > 9 or AF = 1 then: <ul style="list-style-type: none"> • $AL = AL + 6$ • $AH = AH + 1$ • $AF = 1$ • $CF = 1$ else <ul style="list-style-type: none"> • $AF = 0$ • $CF = 0$ in both cases: clear the high nibble of AL.

		<p>Example: MOV AX, 15 ; AH = 00, AL = 0Fh AAA ; AH = 01, AL = 05</p>
AAS	No Operands	<p>ASCII Adjust after Subtraction. Corrects result in AH and AL after subtraction when working with BCD values.</p> <p>Algorithm:</p> <p>if low nibble of AL > 9 or AF = 1 then:</p> <ul style="list-style-type: none"> • AL = AL - 6 • AH = AH - 1 • AF = 1 • CF = 1 <p>else</p> <ul style="list-style-type: none"> • AF = 0 • CF = 0 <p>in both cases: clear the high nibble of AL.</p> <p>Example: MOV AX, 02FFh ; AH = 02, AL = 0FFh AAS ; AH = 01, AL = 09</p>
AAM	No Operands	<p>ASCII Adjust after Multiplication. Corrects the result of multiplication of two BCD values.</p> <p>Algorithm:</p> <ul style="list-style-type: none"> • AH = AL / 10 • AL = remainder <p>Example: MOV AL, 15 ; AL = 0Fh AAM ; AH = 01, AL = 05</p>

INTERRUPTS:**Interrupt INT 21h:**

INT 21h calls DOS functions.

Function 01h- Read character from standard input, result is stored in AL. If there is no character in the keyboard buffer, the function waits until any key is pressed.

Invoked by: **AH** = 01h

Returns: **AL** = character entered.

Example:

```
Mov AH, 01h
INT 21h
```

Function 02h- Write a character to standard output.

INT 21h

Invoked by: **DL** = character to write.

AH = 02h

After execution **AL** = **DL**.

Example:

```
Mov AH, 02h
Mov DL, 'a' ; Character to be displayed on screen must be stored in DL reg.
INT 21h
```

Function 02h- set cursor position.

INT 10h / AH = 2 - set cursor position.

Input:

DH = row.

DL = column.

BH = page number (0..7).

Function 03h- gets cursor position and size.

INT 10h / AH = 03h -

input:

BH = page number.

return:

DH = row.

DL = column.

CH = cursor start line.

CL = cursor bottom line.

Function 06h – Direct console for input/output. If **DL** = 0FFH on entry, then this function reads the console. If **DL** = ASCII character, then this function displays the ASCII character on the console video screen.

Invoked by: Parameters for O/P: **DL** = 0...255

Parameters for I/P: **DL** = 255.

Returns: for O/P: **AL** = **DL**.

For I/P: **ZF** set if no character available & **AL** = 0

ZF clear if character available & **AL** = character.

Example:

```
mov ah, 6
mov dl, 'a'
int 21h    ; output character.
```

```
mov ah, 6
mov dl, 255
int 21h    ; get character from keyboard buffer (if any) or set ZF=1.
```

Function 09h - Write a string to standard output at DS: DX.

String must be terminated by '\$'. The string can be of any length and may contain control characters such as carriage return (0DH) and line feed (0AH).

Invoked by: **DS** = string to write.

AH = 09h

Example:

```
Mov AH, 09h
Mov DX, offset str    ; Address of the string to be displayed
INT 21h
```

Function 2Ch- Get system time.

Invoked by: **AH** = 2Ch

Return: **CH** = hour. **CL** = minute. **DH** = second. **DL** = 1/100 seconds.

Example:

```
Mov AH, 2ch
INT 21h
```

Function 3Ch - Create or truncate file.

Invoked by: **CX** = file attributes:

```
mov cx, 0    ; normal - no attributes.
mov cx, 1    ; read-only.
mov cx, 2    ; hidden.
mov cx, 4    ; system
mov cx, 7    ; hidden, system and read-only!
mov cx, 16   ; archive
mov cx, 0BH  ; Volume label
mov cx, 10H  ; Subdirectory
```

DS: DX -> filename. ; **AH** =3Ch

Returns:

CF clear if successful, **AX** = file handle.
CF set on error **AX** = error code.

Example:

```
Mov AH, 3ch
Mov CX, 01
Mov DX, offset Filename
INT 21h
```

Function 41h - Delete file (unlink).

Invoked by: **DS: DX** -> ASCIZ filename (no wildcards, but see notes).

AH=41h

Return:

CF clear if successful, **AX** destroyed.
CF set on error **AX** = error code.

Example:

```
Mov AH, 41h
Mov DX, offset Filename
INT 21h
```

Function 4Ch - Terminate a process.

Invoked by: **AH** = 4ch

Return: returns control to the operating system.

Example:

```
Mov AH, 4Ch
```

INT 21h

Interrupt INT 10h:

INT 10h calls the BIOS functions. This interrupt often called the video services interrupt as it directly controls the video display in a system.

Function 02h - Set cursor position.

Invoked by: **DH** = row; **DL** = column; **BH** = page number (0...7); **AH**=02h.

Example:

```
MOV AH, 02h
MOV BH, 00
MOV DH, 06
MOV DL, 10
INT 10h
```

Function 03h - Get cursor position.

Invoked by: **BH** = page number. (In general 0)
AH = 03h

Return: **DH** = row number; **DL** = column number; **CH** = cursor start line;
CL = cursor bottom line.

Example:

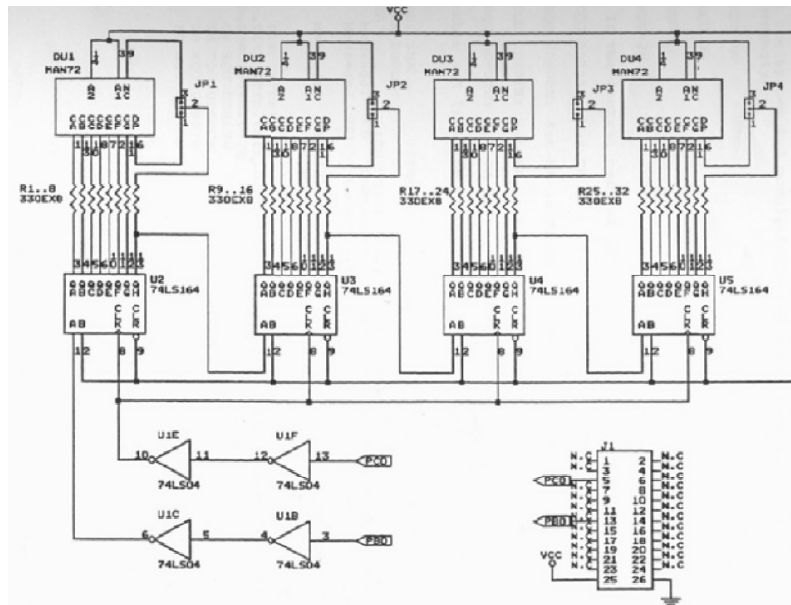

```
Mov BH, 0
Mov AH, 03h
INT 10h
```

Function 06h - Scroll up window

Invoked by: **AL** = number of lines by which to scroll. (00h = clear the entire screen.)
BH = attribute used to write blank lines at bottom of window.
CH, CL = row, column of window's upper left corner.
DH, DL = row, column of window's lower right corner.

Circuit diagrams of interfacing devices

1. Seven Segment Display

The hardware uses four shift register ICs 74164. 74164 is an 8-bit serial in-parallel out shift register with asynchronous reset and two input pins. It requires 8 clock cycles at "CLK" pin to shift the serial data from input to 8 parallel outputs. After 8 shifts, the first serial bit will be in output QH, and only now the data at output is valid. To cascade more 74164 shift register IC need to connect the last output QH to the input of second shift register.

The output is connected to the cathode of the LEDs in the 7 segment display and thus common anode displays are used. The anode is connected to +V_{CC}. The last output of the first shift register is connected to input of the 2nd shift register and the last output of 2nd shift register to input of 3rd and so on. Thus the shift register are serial in parallel out and they are connected to displays, in such a way that output 0A is connected to display segment 'a' and 0B to 'b' and so on up to 0H; through 330 ohm resistors.

The shifting of data bit takes place for each clock cycle. 7404 IC used provides isolation and the interface board gets 5V through port bit.

Pin 1 is used as data pin and pin 2 is used as other input to V_{CC}. The clock signal is generated at a port bit which will be connected to the clock of the shift register.

PB0 is used for data bit; and PC0 for clock through which a falling edge has to be sent.

The microprocessor stores the display information in a RAM. Each time a display has to be updated the microprocessor fetches all bytes one by one from RAM and outputs corresponding display codes serially that is bit by bit to display. Hexadecimal code is stores in the RAM. The code conversion from hexa to 7 segment is done just before the display is updated.

The 7 segment display is used as a numerical indicator on many types of test equipment. It is an assembly of light emitting diodes which can be powered individually. There are two important types of 7-segment LED display.

In a **common cathode** display, the cathodes of all the LEDs are joined together and the individual segments are illuminated by HIGH voltages.

In a **common anode** display, the anodes of all the LEDs are joined together and the individual segments are illuminated by connecting to a LOW voltage.

Display code

Since the outputs of shift registers are connected to cathode sides of displays, low input must be given to segments for making them glow and high inputs for making them blank. Each display has 8 segments (a, b, c, d, e, f, g, h) as shown. For displaying any character the corresponding segment must be given low inputs.

The one shown above is a common anode display since all anodes are joined together and go to the positive supply. The cathodes are connected individually to zero volts. Resistors must be placed in series with each diode to limit the current through each diode to a safe value. The **d.p** represents a decimal point.

The following table shows how to form characters: '0' means that pin is connected to ground. '1' means that pin is connected to Vcc.

	d.p	g	f	e	d	c	b	a	Hex. value
0	1	1	0	0	0	0	0	0	C0
1	1	1	1	1	1	0	0	1	F9
2	1	0	1	0	0	1	0	0	A4
3	1	0	1	1	0	0	0	0	B0
4	1	0	0	1	1	0	0	1	99
5	1	0	0	1	0	0	1	0	92
6	1	0	0	0	0	0	1	0	82
7	1	1	1	1	1	0	0	0	F8
8	1	0	0	0	0	0	0	0	80
9	1	0	0	1	1	0	0	0	98

F	1	0	0	0	1	1	1	0	8e
I	1	1	1	1	1	0	0	1	F9
R	1	0	0	0	1	0	0	0	88
E	1	0	0	0	0	1	1	0	86

2. Stepper Motor:

A stepper motor is a widely used device that translates electrical pulses into mechanical movement. In applications such as disk drives, dot matrix printers, and robotics, the stepper motor is used for Position control.

Every stepper motor has a permanent magnet rotor (also called the shaft.) surrounded by a stator. The most common stepper motors have four common stator windings that are pairs with a center-taped common. This type of stepper motor is commonly referred to as a four-phase stepper motor.

A Stepper motor is stepped from one position to the next by changing the currents through the fields in the motor. Common step sizes for stepper motors range from 0.9 degrees to 30 degrees.

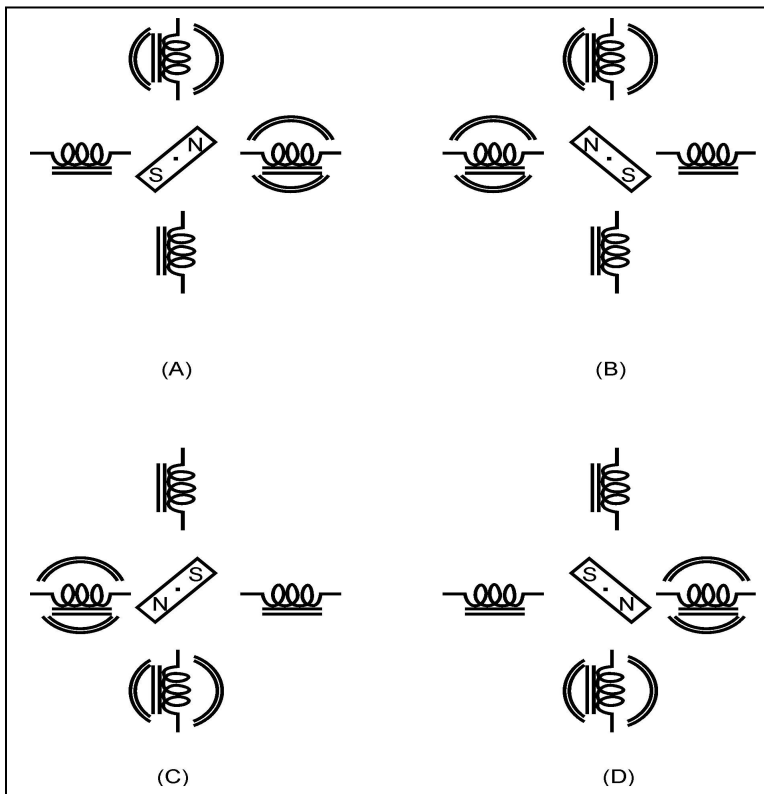

82C55A is used to provide the drive signals that are used to rotate the armature of the motor in either the right-hand or left-hand direction.

The power circuit for one winding of the stepper motor is as shown in figure above. It is connected to the port A (P_{A0}) of 82C55A. Similar circuits are connected to the remaining lower bits of port A (P_{A1} , P_{A2} , P_{A3}). One winding is energized at a time. The coils are turned ON/OFF one at a time successively.

The stepper motor showing full-step operation is shown below.

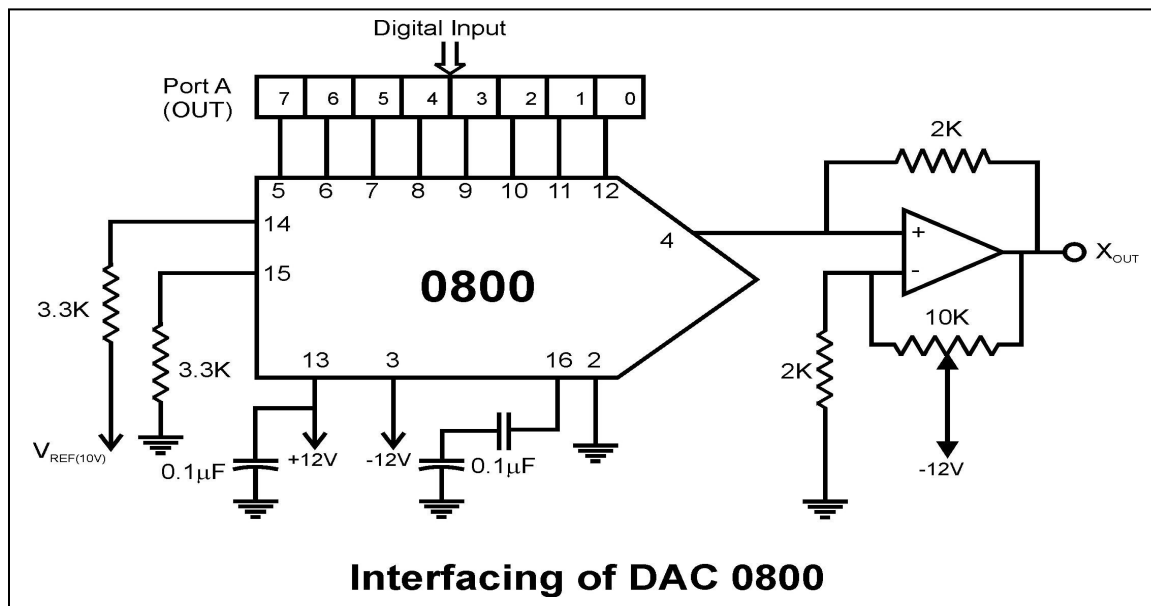

- (A) 45-degrees. (B) 135-degrees (C) 225-degrees (D) 315-degrees.

3. DAC INTERFACE

The pin details of DAC 0800 is given below and schematic diagram of the dual DAC interface is given below.

The port A and port B of 82C55A peripheral are used as output ports. The digital inputs to the DACs are provided through these ports. The analog outputs of the DACs are connected to the inverting inputs of OP-amps 741 which acts as current to voltage converters. The outputs from the OP-amps are connected to points marked X out and Y out at which the waveforms are observed on a CRO. The power supplies of +12 and -12 are regulated for this interface.

ARM LPC 2148 FEATURES:

- 16-bit/32-bit ARM7TDMI-S Microcontroller.
- 40 kB of on-chip static RAM and 512 kB of on-chip flash memory.
- In-System Programming/In-Application Programming (ISP/IAP) via on-chip boot loader software.
- Embedded ICE RT and Embedded Trace interfaces offer real-time debugging with the on-chip Real Monitor software and high-speed tracing of instruction execution.
- USB 2.0 Full-speed compliant device controller with 2 kB of endpoint RAM.
- Two 10-bit ADCs provide a total of 14 analog inputs
- Single 10-bit DAC provides variable analog output
- Two 32-bit timers/external event counters (with four capture and four compare channels each)
- PWM unit (six outputs)
- Watchdog Timer.
- Low power Real-Time Clock (RTC) with independent power and 32 kHz clock input.
- Multiple serial interfaces including two UARTs, two Fast I²C-bus (400 kbit/s), SPI and SSP with buffering and variable data length capabilities.
- Vectored Interrupt Controller (VIC) with configurable priorities and vector addresses.
- 60 MHz maximum CPU clock available from programmable on-chip PLL with settling time of 100 us.
- On-chip integrated oscillator operates with an external crystal from 1 MHz to 25 MHz
- Power saving modes include Idle and Power-down.
- Individual enable/disable of peripheral functions as well as peripheral clock scaling for additional power optimization.

LPC 2148 TECHNICAL SPECIFICATIONS:

- Microcontroller: LPC2148 with 512K on chip memory
- Crystal for LPC2148: 12Mhz
- Crystal for RTC: 32.768KHz
- 6 – 10pin Berg headers for external interfacing(GPIOs)
- No separate programmer required (Program with Flash Magic using on-chip boot loader)
- No Separate power adapter required (USB port as power source)
- 20pin(2X10) FRC JTAG connector for Programming and debugging
- 16 Pin Berg Header for LCD Interfacing
- Two RS-232 Interfaces (UART0 and UART1)
- Real-Time Clock with Battery Holder
- 1 Analog Potentiometer connected to ADC
- 4 USER Switches
- 8 USER LEDs
- Reset and Boot loader Switches
- On Board Buzzer Interface

HOW TO USE KEIL μ VISION4

For ARM7 (LPC2148) Step By Step

Keil is on the tool which is widely used in Industry, KEIL has tools for ARM, Cortex-M, Cortex-R, 8051, C166, and 251 processor families. In this article we are going to discuss KEIL tools for ARM. The development tools of for ARM include following...

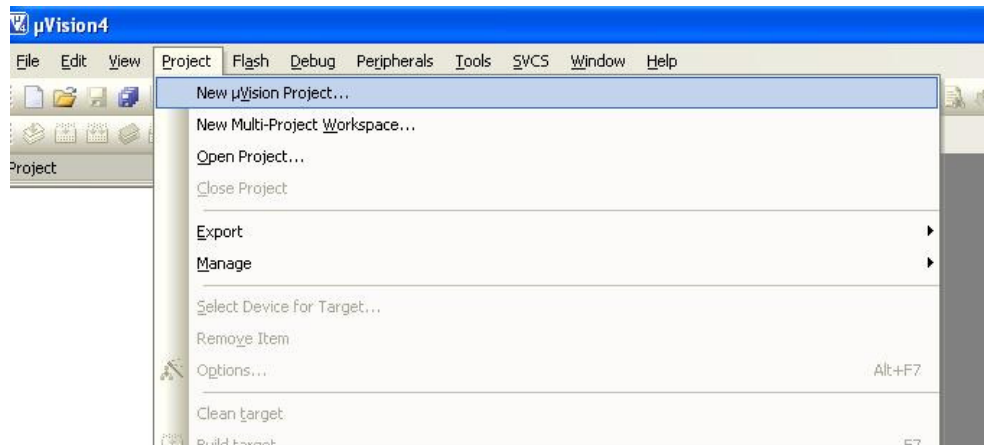

1. μ vision IDE v4
2. Compiler for ARM (armcc)
3. MicroLib (C library)
4. Assembler for ARM (armasm)
5. Linker For ARM (armLink)

Step1: Click for KEIL μ VISION4 Icon .

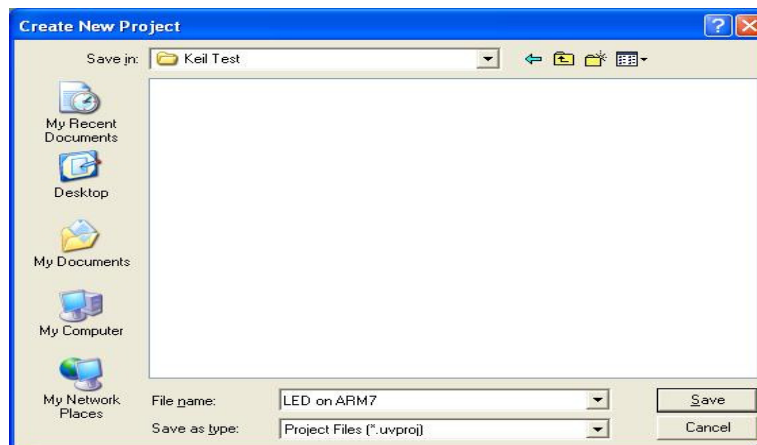

Which appearing after Installing Keil KEIL μ VISION4.

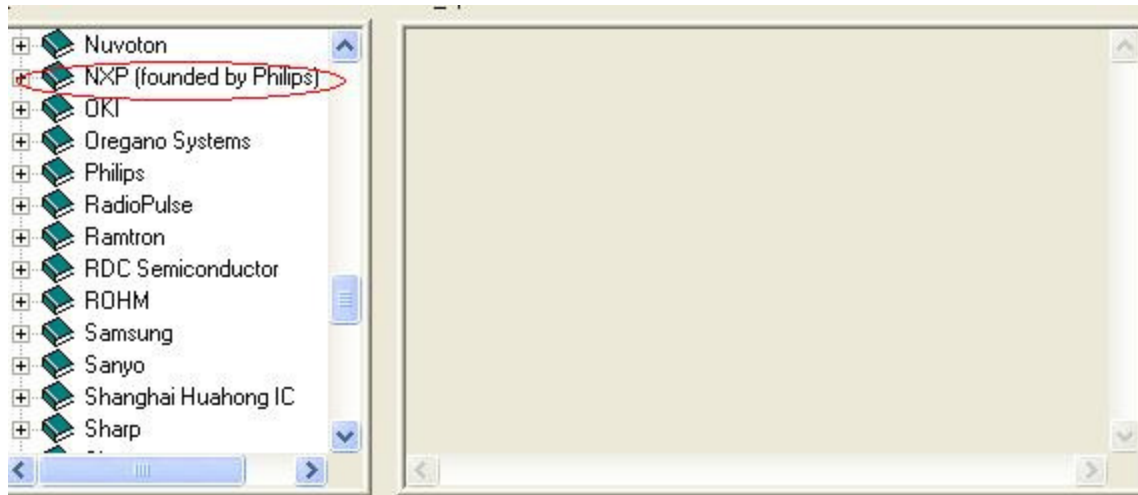

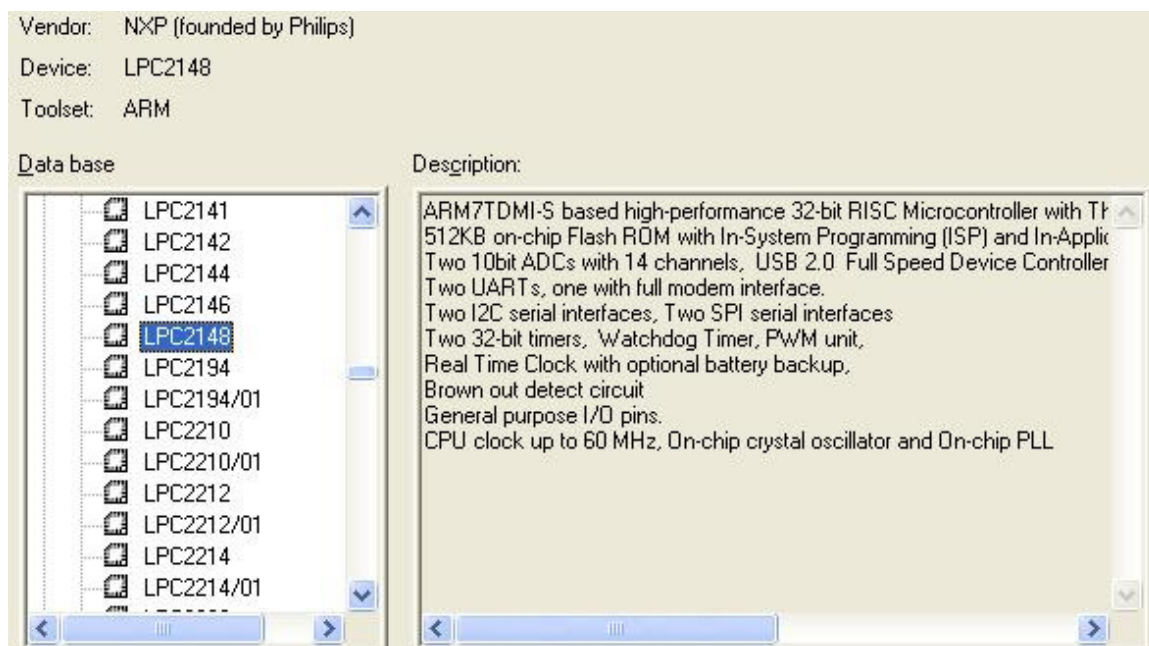

This will open uvision IDE.

Step2: Click on Project Menu, Then **New μ Vison Project**.

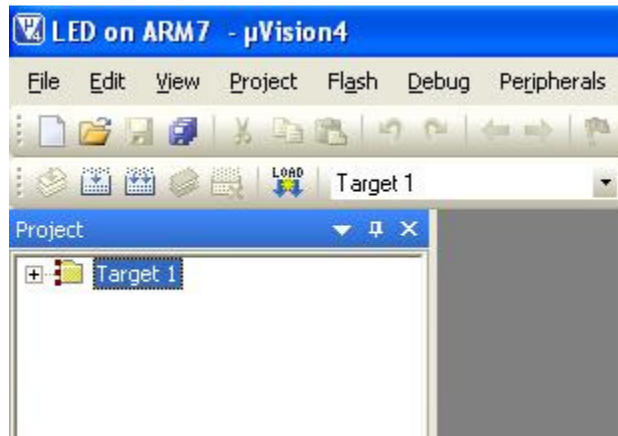

Step3: Create New Project Folder named as “Keil Test”.

Step 4: Select Target Device**Step 5: Then select specific chip LPC2148.****Step 6: Then select specific chip i.e. LPC2148.**

Step 7: Then you will see following window

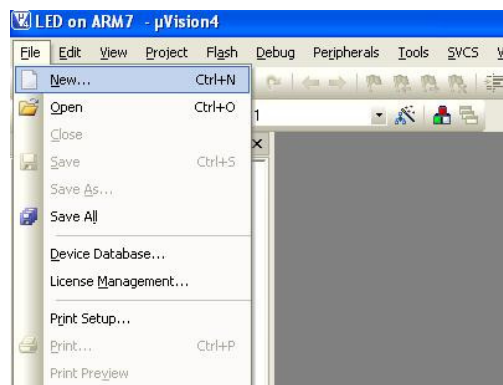

Step 8: Now you see Startup.s is already added which is necessary for running code for Keil.

Note: Code will Not Run without Startup.s

Startup.s is available in C:\Keil\ARM\Startup\Philips.

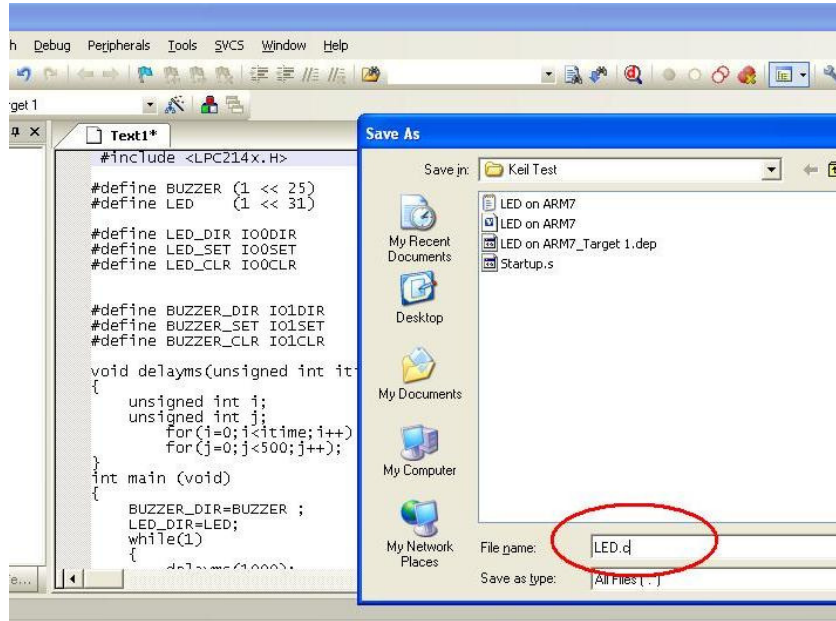

Step 9: Now Click on File Menu and Click on New.

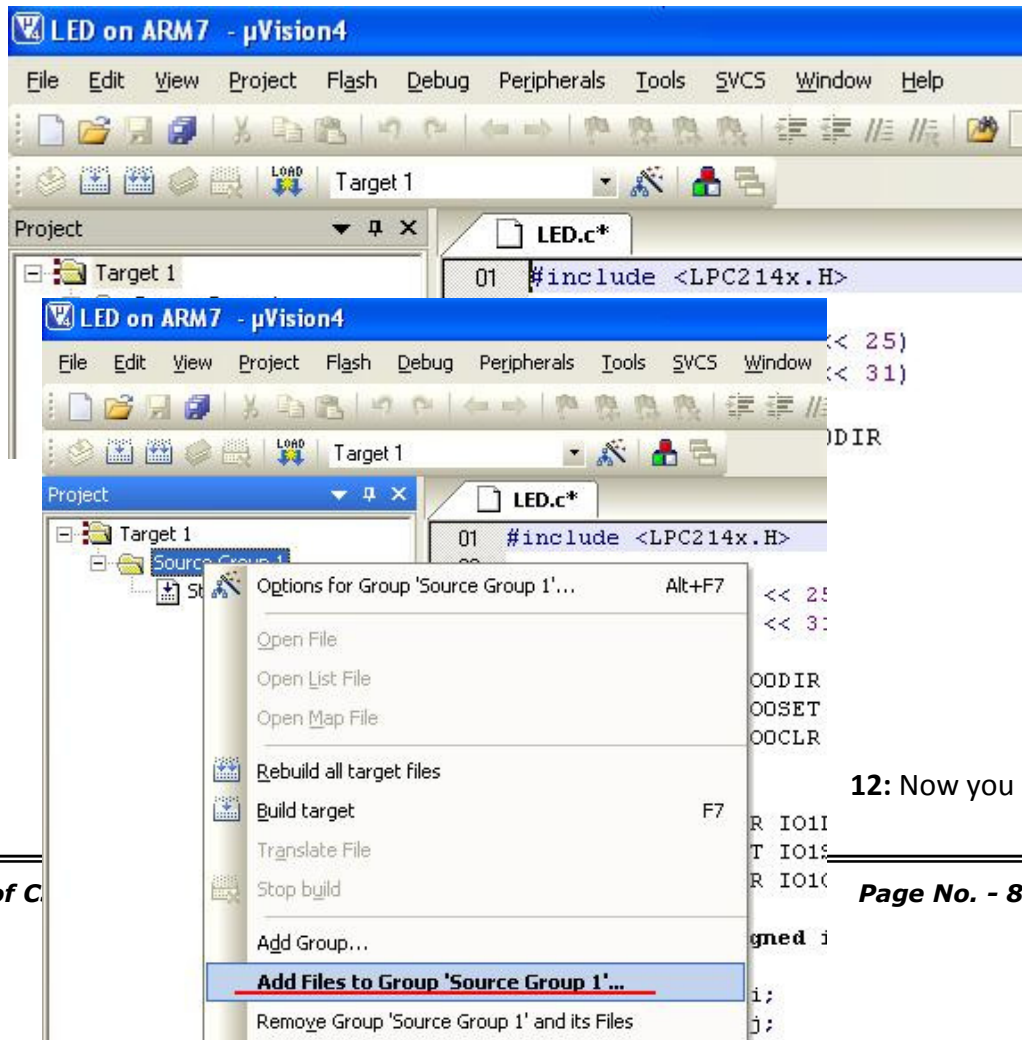

Step 10: Write Code for Blink LED in C OR ASM and FileName.c/ASM Save.

Note: Don't forget to save .c/ASM Extension.

Step 11: Now you Window in C Syntax.

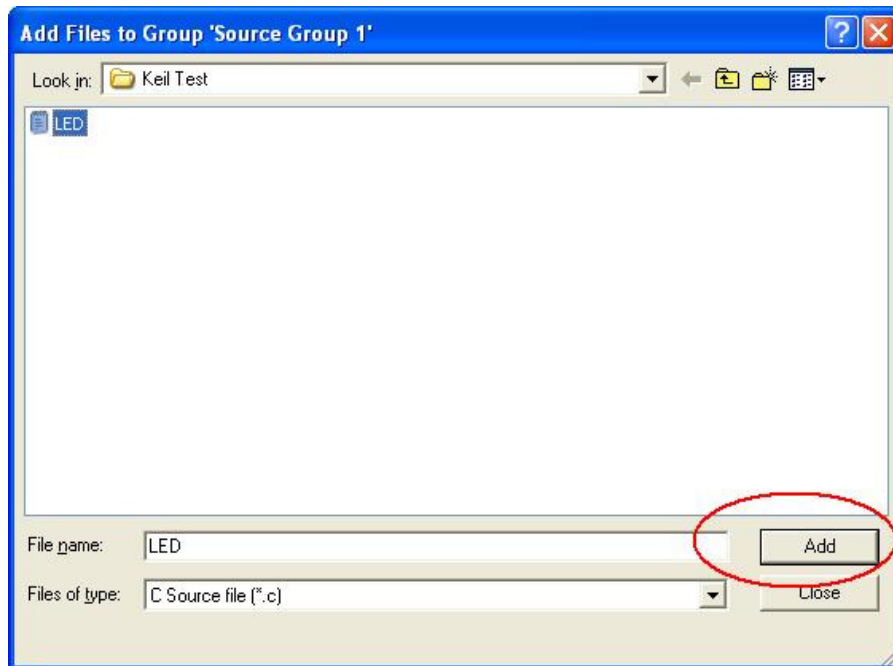

Step

12: Now you

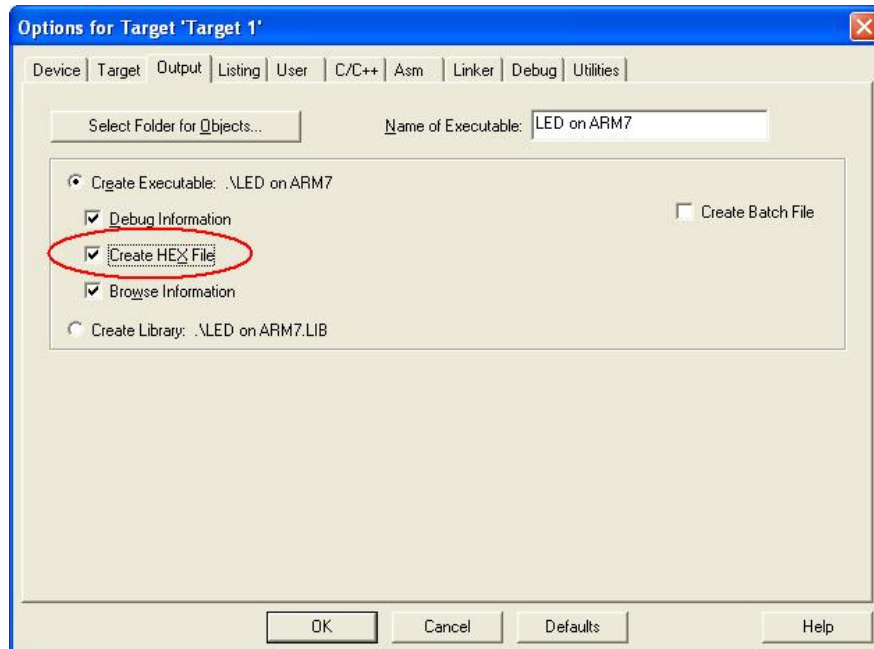

add LED.c file by adding Source Group 1 Add files to Group 'Source Group 1'.

Step 13: Add LED.C file.

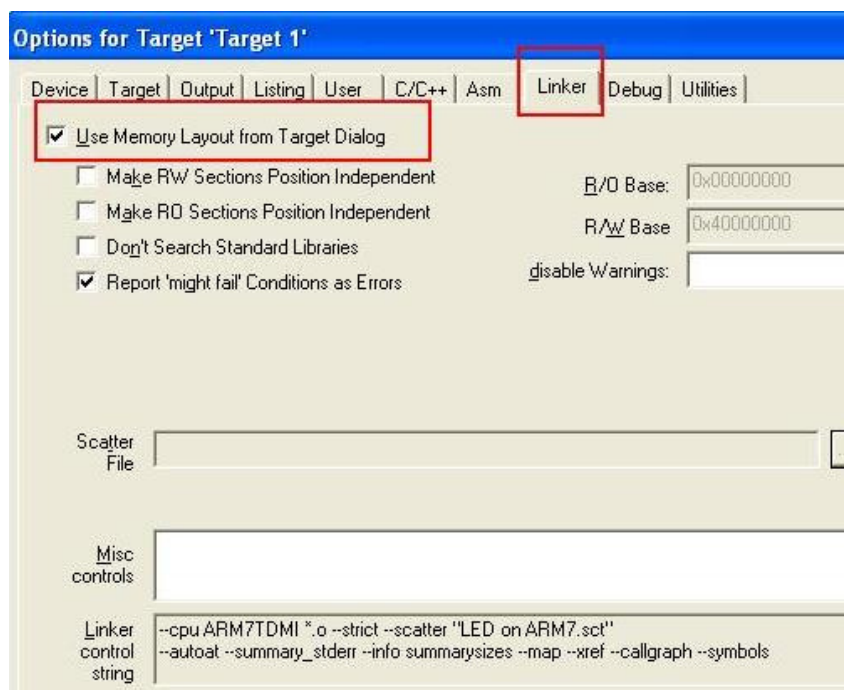

Step 14: Now Click on Options for Target 'Target 1'.

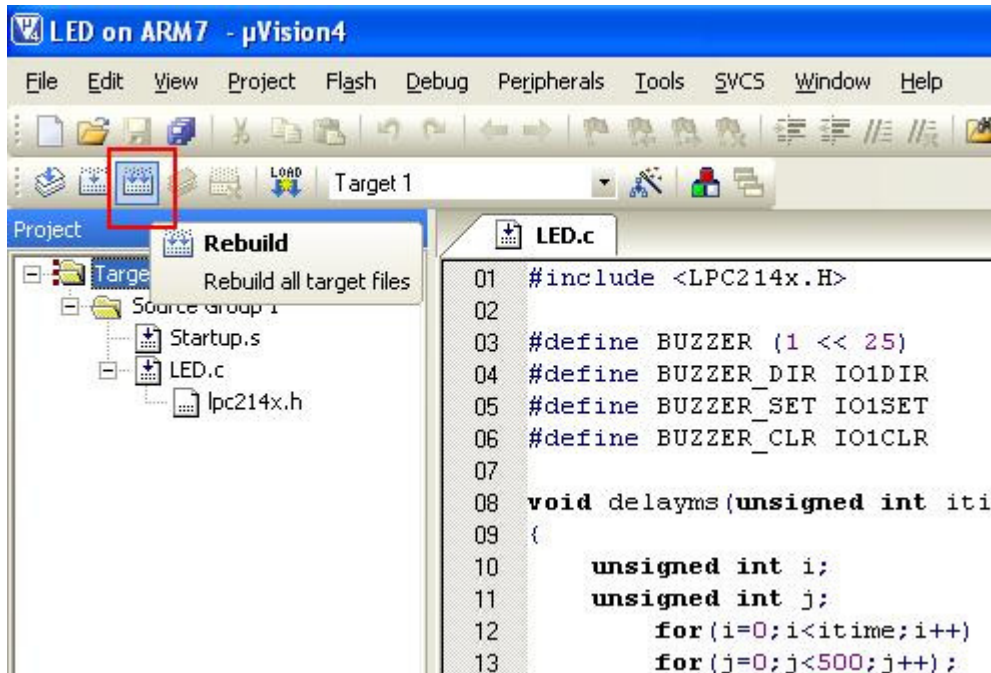

Step 15: Go to Options for Target 'Target 1'. Click on Check Box Create HEX File.

Step 16: Then go to Linker. Click on Use Memory Layout for Target Dialog.

Step 17: Then Click on Rebuild All Target Files

Step 17: Now you see 0 Error(s), 0 Warning(s). Then Hex File will create in Specific Folder. Now to download it for you target hardware.

```
Build Output
Build target 'Target 1'
assembling Startup.s...
compiling LED.c...
linking...
Program Size: Code=880 RO-data=16 RW-data=0 ZI-data=1256
FromELF: creating hex file...
"LED on ARM7.axf" - 0 Error(s), 0 Warning(s).
```

Viva Questions and Answers**1. What is a Microprocessor?**

ANS: Microprocessor is a program-controlled device, which fetches the instructions from memory, decodes and executes the instructions. Most Micro Processor are single- chip devices.

2. What is the difference between 8086 and 8088?

ANS: The BIU in 8088 is 8-bit data bus & 16- bit in 8086. Instruction queue is 4 byte long in 8088 and 6 byte in 8086.

3. what are the functional units in 8086?

ANS: 8086 has two independent functional units because of that the processor speed is more. The Bus interface unit and Execution unit are the two functional units.

4. What are the flags in 8086?

ANS: In 8086 Carry flag, Parity flag, Auxiliary carry flag, Zero flag, Overflow flag, Trace flag, Interrupt flag, Direction flag, and Sign flag.

5. What is the Maximum clock frequency in 8086?

ANS: 5 Mhz is the Maximum clock frequency in 8086.

6. What are the various segment registers in 8086?

ANS: Code, Data, Stack, Extra Segment registers in 8086.

7. Logic calculations are done in which type of registers?

ANS: Accumulator is the register in which Arithmetic and Logic calculations are done.

8. How 8086 is faster than 8085?

ANS: Because of pipelining concept. 8086 BIU fetches the next instruction when EU busy in executing the another instruction.

9. What does EU do?

ANS: Execution Unit receives program instruction codes and data from BIU, executes these instructions and store the result in general registers.

10. Which Segment is used to store interrupt and subroutine return address registers?

ANS: Stack Segment in segment register is used to store interrupt and subroutine return address registers.

11. What does microprocessor speed depend on?

ANS:The processing speed depends on DATA BUS WIDTH.

12. What is the size of data bus and address bus in 8086?

ANS: 8086 has 16-bit data bus and 20-bit address bus.

13. What is the maximum memory addressing capability of 8086?

ANS: The maximum memory capability of 8086 is 1MB.

14. What is flag?

ANS:Flag is a flip-flop used to store the information about the status of a processor and the status of the instruction executed most recently.

15. Which Flags can be set or reset by the programmer and also used to control the operation of the processor?

ANS: Trace Flag, Interrupt Flag, Direction Flag.

16. In how many modes 8086 can be operated and how?

ANS: 8086 can be operated in 2 modes. They are Minimum mode if MN/MX pin is active high and Maximum mode if MN/MX pin is ground.

17. What is the difference between min mode and max mode of 8086?

ANS: Minimum mode operation is the least expensive way to operate the 8086 microprocessor because all the control signals for the memory and I/O are generated by the micro processor. In Maximum mode some of the control signals must be externally generated. This requires the addition of an external bus controller. It is used only when the system contains external coprocessors such as 8087 arithmetic coprocessor.

18. Which bus controller is used in maximum mode of 8086?

ANS: 8288 bus controller is used to provide the signals eliminated from the 8086 by the maximum mode operation.

19. What is stack?

ANS:Stack is a portion of RAM used for saving the content of Program Counter and general purpose registers.

20. Which Stack is used in 8086?

ANS:FIFO (First In First Out) stack is used in 8086. In this type of Stack the first stored information is retrieved first.

21. What is the position of the Stack Pointer after the PUSH instruction?

ANS:The address line is 02 less than the earlier value.

22. What is the position of the Stack Pointer after the POP instruction?

ANS:The address line is 02 greater than the earlier value.

23. What is interrupt?

ANS: Interrupt is a signal send by external device to the processor so as to request the processor to perform a particular work.

24. What are the various interrupts in 8086?

ANS:Maskable interrupts, Non-Maskable interrupts.

25. What is meant by Maskable interrupts?

ANS: An interrupt that can be turned off by the programmer is known as Maskable interrupt.

26. What is Non-Maskable interrupts?

ANS: An interrupt which can be never be turned off (ie.disabled) is known as Non-Maskable interrupt.

27. Which interrupts are generally used for critical events?

ANS:Non-Maskable interrupts are used in critical events. Such as Power failure, Emergency, Shut off etc.,

28. Give example for Non-Maskable interrupts?

ANS:Trap is known as Non-Maskable interrupts, which is used in emergency condition.

29. Give examples for Maskable interrupts?

ANS: RST 7.5, RST6.5, RST5.5 are Maskable interrupts. When RST5.5 interrupt is received the processor saves the contents of the PC register into stack and branches to 2Ch (hexadecimal) address.

When RST6.5 interrupt is received the processor saves the contents of the PC register into stack and branches to 34h (hexadecimal) address.

When RST7.5 interrupt is received the processor saves the contents of the PC register into stack and branches to 3Ch (hexadecimal) address.

30. What is SIM and RIM instructions?

ANS: SIM is Set Interrupt Mask. Used to mask the hardware interrupts. RIM is Read Interrupt Mask. Used to check whether the interrupt is Masked or not.

31. What is macro?

ANS: Macro is a set of instructions that perform a task and all the instructions defined in it is inserted in the program at the point of usage.

32. What is the difference between Macro and Procedure?

ANS: A procedure is accessed via a CALL instruction and a macro will be inserted in the program at the point of execution.

33. What is meant by LATCH?

ANS: Latch is a D-type flip-flop used as a temporary storage device controlled by a timing signal, which can store 0 or 1. The primary function of a Latch is data storage. It is used in output devices such as LED, to hold the data for display.

34. What is a compiler?

ANS: Compiler is used to translate the high-level language program into machine code at a time. It doesn't require special instruction to store in a memory, it stores automatically. The Execution time is less compared to Interpreter.

35. What is the disadvantage of microprocessor?

ANS: It has limitations on the size of data. Most Microprocessor does not support floating-point operations.

36. What is the 82C55A device?

ANS:The 8255A/82C55A interfaces peripheral I/O devices to the microcomputer system bus. It is programmable by the system software. It has a 3-state bi-directional 8-bit buffer which interfaces the 8255A/82C55A to the system data bus.

37. What kind of input/output interface does a PPI implement?

ANS: It provides a parallel interface, which includes features such as single-bit, 4-bit, and byte-wide input and output ports; level-sensitive inputs; latched outputs; strobed inputs or outputs; and strobed bidirectional input/outputs.

38. How many I/O lines are available on the 82C55A?

ANS: 82C55A has a total of 24 I/O lines.

39. Describes the mode 0, mode 1, and mode 2 operations of the 82C55A?

ANS: MODE 0: Simple I/O mode. In this mode, any of the ports A, B, and C can be programmed as input or output. In this mode, all the bits are out or in.

MODE 1: Ports A and B can be used as input or output ports with handshaking capabilities. Handshaking signals are provided by the bits of port C.

MODE 2: Port A can be used as a bidirectional I/O port with handshaking capabilities whose signals are provided by port C. Port B can be used either in simple I/O mode or handshaking mode 1.

40. What is the mode and I/O configuration for ports A, B, and C of an 82C55A after its control register is loaded with 82H?

ANS: If control register is loaded with 82H, then the port B is configured as an input port, port A and port C are configured as output ports and in mode 0.
